As graduate students on the Mobilize grant \cite{1}, we have had the opportunity to interact with Los Angeles high school teachers and students who are trying to learn R. Over the years of the grant, we have learned some factors that can help or hinder learning of R at the high school level.

In this talk, we will reflect on lessons we have learned about teaching R to this particular audience. We will discuss some of the pedagogical decisions surrounding R that have been made in the various pieces of Mobilize curriculum, including the use of the mosaic package \cite{3}, as well as our own package of wrapper functions, MobilizeSimple \cite{2}.
